**What does Arges mean for your company**

The precise coordination of your production processes means that the right information has to be in the right place at the right time. Arges optimizes the coordination by using the ISA-95 and ISA-88 standards (www.isa-95.com). Combined with the latest Microsoft architecture, our MES system is future ready and particularly user friendly and flexible. Arges offers the best possible price/performance ratio on the market - try us!

What is Arges?

It is a MES system that is based on the latest standards and Microsoft architecture. More than twenty years of experience using MES systems in different industries were poured into the development of Arges. Using the ISA-95 standard enables Arges to close the gap between ERP and production control. You no longer need the budget of a multinational to benefit from the advantages of standardization. Read more about the benefits and watch the product demonstration.

Benefits of Arges are:**Flexibility and Low Maintenance Costs**

Every factory is different, which is why Arges works with a factory model that is fully configurable (process structure and flow, equipment). The same applies to the recipe structure. Clever use of the ISA-95 and ISA-98 models enables Arges to provide you with all of these benefits.

Extensive Reporting Options

Arges comes with extensive reporting functionality, but because we can't answer tomorrow's questions today, Arges has an open database so you can access the data and possibly answer them yourself. The open database also makes it easy to plug in BI tools or SPC/SQC packages. Reports can be exported to Word, Excel, PDF and used for your document control.

User friendly

Aimed at the processes in your factory using the screens your staff are familiar with so they don't have to spend valuable time searching and changing contexts. The particularly intuitive user interface prevents mistakes. Real-time data validation prevents user's getting irritated. Where necessary, Arges uses wizards and templates.

Future ready

Arges is designed and developed according to the ISA-95 and ISA-88 standards, making it very scalable. The modular structure and flexible interfaces between the modules give you ample room to adapt Arges to your needs. Standard communication modules are available and custom modules are obtainable (pluggable).

Multilingual

Arges is multilingual, meaning that you can use the same software to optimize your international factories.

Reliable

Solid architecture structured according to Patterns & Practices recommended by Microsoft that has already proven itself in numerous situations. The modern Microsoft technology and the ISA-95 and ISA-88 models give Arges the reliability you should be able to expect.

Stable

The solid architecture and the guarantee that the software works according to specification (code generation and automatic testing) ensure that your MES is robust. The extensive logging functionality enables errors to be traced and incidents to be analyzed.
